

Overview

For this homework assignment, you will set up an account on 000webhost, a free web hosting service. If you already have your own PHP and MySQL webhosting service, feel free to use that instead of webhost. However, note I might not be able to support you because your interface will likely be different from what is below. The instructions for this and all subsequent homework assignments assumes your use of a Windows-based machine. If you don't have Windows, just perform the equivalent command on your own operating system.

Go to www.000webhost.com. Take note of the number of 0s in front. Select "Free Sign Up." For some reason, webhost.com doesn't like email addresses like ours. You will have to sign up with a "reputable" email address, like one from Yahoo or Google. If you don't have an account with those providers, create one and come back here.

+ Create New Site

Create an account. Then, select "Create New Site". Give your site a name. I suggest your MST userID as a good name for the site. Make sure to choose a password you can remember- otherwise you won't be able to edit your own site!

New Website

Website Name (optional)

cecq8z.000webhostapp.com

Password

NU%O8ryMp1K6obsv^JlK

☒ Show password

GENERATE ANOTHER PASSWORD

Create

Once you create your site, it will appear on the dashboard. Click on the picture of your site to enter it.

Select “File Manager” as the option to manage your website.

File Manager

Upload your own prebuilt website. For Advanced users.

[Upload >](#)

You should now see a screen that looks like this:

In NotePad (or the equivalent text editor in your operating system), type the following:

```
<html>
<head>
  <title>My first web page</title>
</head>
```

```
<body>
  <p>My first web page.</p>
</body>
</html>
```

Save the file as “test.html” on your hard drive.

Go back to your webhost account, and click on the  button. Then click “Select Files.” Upload the file test.html to your webhost account.

If that worked, you should be able to see your file by going to your browser, and typing:

`http://<yourwebsite>.000webhostapp.com/test.html`

Download the following files from Canvas. They should all be in the Generic Course Materials module:

- Hospital_mysql.sql: The database we will use to learn SQL commands with.
- Amazonia_extended.sql: The database that will be used to assess your knowledge of SQL commands.

Log into webhost. Select Tools, Database Manager.

Select New Database

[+ New Database](#)

The database name, and username should be amazonia. Set your password to something that: (1) you can remember, (2) you do not mind sharing with me. Note if you ever need help debugging PHP code, your PHP code will have this password embedded in plain text. I am therefore going to see your database password and you don’t want me to know the password you use for other things.

When you create the database, it will not actually give it the name you define. Instead, that name will be appended to a string of digits. In my case, the database is id11304588_amazonia

DB Name	DB User	DB Host	
id11304588_amazonia	id11304588_amazonia	localhost	Manage ▾

Note the db name and db user of the database. We will need this information later.

Now click Manage\PHPMyAdmin

In PHPMyAdmin, click on the database. In my case, it is id11304588_amazonia.

Please note this! A lot of students skip this step. The default database is information_schema, which is protected. You must click on your database, for this to work. Click Import.

Choose File Amazonia_extended.sql.

☒ Browse your computer: amazonia.mysql

Format should be SQL (default). SQL compatibility mode: MySQL 40

SQL compatibility mode:

Click Go.

If successful, your database should be populated by 10 tables.

Do the same thing for the hospital_mysql.sql file. This time, call the database and username hospital.

DELIVERABLES

1. A screenshot of the tables in Amazonia. Like this:

The screenshot shows the phpMyAdmin interface for the database 'u857788680_hospital_test'. The left sidebar lists the database structure, including tables like 'bill', 'billitem', 'doctor', 'nurse', 'patient', 'rcptdetail', 'receipt', 'staff', 'supervises', and 'ward'. The main panel displays a table of tables with columns: Table, Action, Rows, Type, Collation, Size, and Overhead. The table lists 10 tables, all using InnoDB engine and utf8mb4_unicode_ci collation.

Table	Action	Rows	Type	Collation	Size	Overhead
bill	Browse Structure Search Insert Empty Drop	6	InnoDB	utf8mb4_unicode_ci	48.0 K	-
billitem	Browse Structure Search Insert Empty Drop	15	InnoDB	utf8mb4_unicode_ci	32.0 K	-
doctor	Browse Structure Search Insert Empty Drop	23	InnoDB	utf8mb4_unicode_ci	16.0 K	-
nurse	Browse Structure Search Insert Empty Drop	29	InnoDB	utf8mb4_unicode_ci	32.0 K	-
patient	Browse Structure Search Insert Empty Drop	30	InnoDB	utf8mb4_unicode_ci	48.0 K	-
rcptdetail	Browse Structure Search Insert Empty Drop	11	InnoDB	utf8mb4_unicode_ci	32.0 K	-
receipt	Browse Structure Search Insert Empty Drop	6	InnoDB	utf8mb4_unicode_ci	32.0 K	-
staff	Browse Structure Search Insert Empty Drop	52	InnoDB	utf8mb4_unicode_ci	16.0 K	-
supervises	Browse Structure Search Insert Empty Drop	48	InnoDB	utf8mb4_unicode_ci	32.0 K	-
ward	Browse Structure Search Insert Empty Drop	6	InnoDB	utf8mb4_unicode_ci	16.0 K	-
10 tables	Sum	226	InnoDB	utf8mb4_unicode_ci	304.0 K	0 B

2. A screenshot of the tables in hospital.
